

We recommend that these steps are done shortly before the new season

Make sure that the beads are not left in open air during cooling and that the containers are sealed (no humidity input).

Drying Beads®

RR Consumables

Improving your yield through better farm-saved seed storage

Rhino Research Group

Why would we change our seed storage system?

Classical seed storage result in a quick loss of vigor and germination potential due to temperature/seed moisture

The storage of the seeds in combination with the Drying Bead® will minimize the quality reduction due to their storage

How can we improve our storage system with drying beads ?

These 3 steps to be done as soon as possible after harvest

These steps have to be done 1 - 2 days before planting
